

## 2 CHANNEL BLENDER

**T**he Morley product line of Accutronics, Inc., proudly announces the introduction of the Compact 2 Channel Blender (CCB).

"We were approached by Jim Seig, a guitarist and owner of Guitar Attic, Island Lake, Illinois. Jim asked if we could design a pedal which would solve the problem of 'hands-free' control over the volume mix of the normal and synthesized voice outputs of the latest generation of MIDI guitars. Jim wanted a pedal to blend in the synthesized voice during the performance of a song. Bob Emmerman of our MORLEY staff was given the project, and the Compact 2 Channel Blender (CCB) was the result," says Randy Wright, Operations Manager of MORLEY.

The CCB gives the player full and even control over the volume blend of two instrument channels, each with separate inputs and outputs. It allows the foot to select all of one instrument or the other, a studio-smooth blend between the two sounds, or any mixture in between.

Additionally, when only one input is used, the pedal will allow 'panning' of this single source between the two outputs. The Compact 2 Channel Blender matches this cost-effective versatility with the same rugged construction that has long been synonymous with the MORLEY name.
